Summary

System Design Verification Engineer / Software Test Engineer with 5 years of experience validating Android-based storage systems in large-scale automated lab environments.

Specialized in test infrastructure verification (Staging) and firmware qualification (Production) as part of the customer-release pipeline.

Strong background in automated test execution, stress, performance, regression, UI and functional testing, failure triage, and release readiness across 100+ Android devices.

Experience

[2020 – 2025] System Design Verification Engineer (Test Engineer – V&V)

SanDisk / Western Digital

- Executed large-scale **automated validation campaigns** on Android devices with embedded **iNAND flash**, qualifying firmware releases for customer delivery.
- Planned test runs with **Validation** and **Firmware** teams, select test suites, configure execution parameters, and define logging per validation cycle.
- Operated as a **quality gate** between test development and firmware release across **Staging and Production** environments.
- **Staging**: verified **VLD test packages themselves** on stable firmware, detecting faulty tests early and preventing invalid results from reaching production.
- **Production**: qualified firmware through **weekly FW progression**, running Functional, Regression, Stress, Performance, and UI tests until reaching a stable, customer-ready release.
- Performed **initial failure analysis** using logs and ADB; opened and tracked JIRA defects, routing issues to Firmware or Validation teams as appropriate.
- Triggered, monitored, and analyzed automated runs using an internal automation framework; modified **XML configurations** to control runtime, logging scope, and behavior.
- Developed **Python (Tkinter) GUI tools** that reduced per-device setup time from **~7 minutes to ~1 minute** (~85% reduction), significantly improving lab throughput.
- Wrote and modified **Linux shell scripts** to support automation workflows and data handling.
- Managed and maintained **300+ lab PC stations**, ensuring high availability and parallel execution across 100–150 devices per run.
- Analyzed test and performance results via **PowerBI outputs**, exporting and processing data in Excel for validation and reporting.
- Managed firmware and test artifacts using **JFrog Artifactory**.

Skills

Testing: System Verification & Validation (V&V), Firmware Qualification, Test Infrastructure Verification (Staging), Functional, Regression, Stress, Performance & UI Testing, Failure Analysis, Release Readiness.

Programming & Automation: Python, Tkinter, Linux Shell Scripting, ADB, XML Configuration, Automated Test Execution.

Systems & Tools: Android OS, NAND / iNAND, Windows, Linux, JFrog Artifactory, JIRA, PowerBI, Excel, GitHub, Jenkins, TestRail, Lab Management

Education

[2015 – 2019] **B.Sc. Software Engineering** — ORT Braude College of Engineering

[2011 – 2013] **Practical Electrical Engineering** — ORT Braude College of Engineering

Languages

English – Fluent | **Hebrew** – Fluent | **Arabic** – Native
